Zeroth review / Title Approval

Tentative Project title: PREDICTIVE CROWD MANAGEMENT AND RESOURCE ALLOCATION FOR PUBLIC SECTORS

Abstract

Government offices often face long queues, overcrowding, and unpredictable waiting times, especially during peak hours. Most existing queue management systems are limited to physical or digital tokens and lack intelligent waiting-time prediction and congestion management. The goal of this project is to develop an AI-Based Government Queue Management System that provides online appointment booking, digital token generation, virtual queue tracking, and real-time notifications. The system will use AI and Machine Learning to analyze real-time and historical data such as queue length, service time, citizen arrival rate, and counter availability to predict waiting times and forecast crowd congestion. It will also provide intelligent counter-allocation recommendations to help administrators manage resources efficiently. Citizens can track their live queue position and receive notifications when their turn approaches, reducing unnecessary in-person waiting time. By integrating AI/ML, real-time queue management, and digital services, the system aims to reduce high occupancy, improve resource utilization, and provide faster, unobscured service framework, and efficient public services across multiple government offices.
